The "get" lets you treat a class method, as if it were a simple property in an object. If you leave off the "get", you can still access the value by calling `.area ()` instead of just `.area`

11 request.GET is the dictionary of the GET variables in the http request made to your server for example:

The get/set pattern provides a structure that allows logic to be added during the setting ("set") or retrieval ("get") of a property instance of an instantiated class, which can be useful when ...

What is confusing you? You evidently know what `.get` invoked on a dictionary does, that's what's being called for each key in the dictionary.

ajax jquery simple get request Asked 14 years ago Modified 6 years, 6 months ago Viewed 265k times

Is it possible to pass parameters with an HTTP get request? If so, how should I then do it? I have found an HTTP post request (link). In that example the string postData is sent to a webserver. I ...

Ultimately it probably doesn't have a safe `.get` method because a dict is an associative collection (values are associated with names) where it is inefficient to check if a key is present (and return its value) ...

From what I can gather, there are three categories: Never use GET and use POST Never use POST and use GET It doesn't matter which one you use. Am I correct in assuming those three ...

Here the get method finds a key entry for "e" and finds its value which is 1. We add this to the other 1 in `characters.get (character, 0) + 1` and get 2 as result.

Non-data descriptors, instance and class methods, get their implicit first arguments (usually named self and cls, respectively) from their non-data descriptor method, `__get__` - and this ...
