What are power electronic converters in microgrids?

Power electronic converters in microgrids use various topologies, according to different applications. Based on the input and output power, power electronic converters can be classified as DC/DC converters and DC/AC converters. DC/DC converters convert the input DC voltages and currents into controlled output DC voltages and currents.

What types of converters are used in microgrids?

Then, different topologies of the converters used in microgrids are discussed, including DC/DC converters, single-phase DC/AC converters, three-phase three-wire, and four-wire DC/AC converters. The remaining parts of this chapter focus on how to optimally design and control these converters with the emerging wide-bandgap semiconductors.

Is a solar converter suitable for DC and AC microgrids?

Husev et al. [11] introduced a solar converter with universal applicability for both DC and AC microgrids. This converter's ability to adapt to different grid configurations and energy sources makes it a versatile solution for renewable energy integration.

Can a three-phase modular converter be used in DC and AC microgrids?

Roncero-Clemente, C. et al. Feasibility study of three-phase modular converter for dual-purpose application in DC and AC microgrids. *IEEE J. Emerg. Select. Top. Power Electron.* 12 (2), 1348-1358 (2024).
