-----

The photovoltaic effect in a solar cell can be illustrated with an analogy to a child at a slide. Initially, both the electron and the child are in their respective "ground states."

The conversion of solar energy into chemical energy occurs in two main stages: the light-dependent reactions and the light-independent reactions (Calvin Cycle).

Thermal energy from the sun can be stored as chemical energy in a process called solar thermochemical energy storage (TCES). The thermal energy is used to drive a reversible ...

Photosynthesis is a fundamental biological process that allows plants, algae, and some bacteria to create their own food. This process involves an energy transformation where light energy from the ...

By absorbing the sun's blue and red light, chlorophyll loses electrons, which become mobile forms of chemical energy that power plant growth.

Discovered in the 19th century, the photovoltaic effect occurs when photons, the particles that make up light, strike a material, causing the release of electrons. In solar panels, the...

The overall function of light-dependent reactions, the first stage of photosynthesis, is to convert solar energy into chemical energy in the form of NADPH and ATP, which are used in light-independent ...

The overall function of light-dependent reactions is to convert solar energy into chemical energy in the form of NADPH and ATP. This chemical energy supports the light-independent reactions and fuels ...

This research shows that solar energy can directly enable chemical conversion to multicarbon products--complex carbon molecules useful for industry. It thus unlocks the potential for ...
