How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells, or photovoltaic cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

How do solar panels make electricity?

Sunlight plays a big role in making electricity through solar panels. These panels have photovoltaic cells made from materials like monocrystalline silicon or thin-film semiconductor materials. Think of these cells as tiny power producers that take light from the sun and turn it into energy.

What is solar energy & how does it work?

Solar energy comes from the sun's radiation, reaching Earth in abundant amounts every day. This renewable source can power every home across the United States and even the whole planet, making it a crucial player in our energy landscape. Photovoltaic (PV) modules play a key role by converting this sunlight into usable electric power.

How do solar panels work?

A solar panel consists of several key parts working together to convert sunlight into electricity: Photovoltaic (PV) cells: These semiconductors, often made of silicon, absorb sunlight and initiate the energy conversion process. Glass layer: This durable outer layer protects the PV cells while allowing sunlight to pass through.
