Aiming at the existing problems, the invention provides the solar photovoltaic panel hot knife stripping device, which avoids the situation that the crystalline silicon at the position of a...

This study aimed to analyze vibration-assisted knife cutting, striving to achieve detachment with minimal damage to the glass layer under room temperature conditions.

The study has successfully demonstrated the effectiveness of the hot knife technique in separation the back sheet layer from silicon-based photovoltaic (PV) panels.

Amplitude in a vibration knife refers to the vertical displacement--the distance the blade travels up and down during operation. This parameter significantly influences the cutting performance ...

The objective of this study is to complete a life cycle assessment (LCA) of a novel technology that separates the crystalline silicon (c-Si) photovoltaic (PV) module front glass from the backsheet using ...

A customer needed six vibrating knife cutting machines to cut photovoltaic panels, but some were too slow, and others had burrs on the edges.

The findings reveal that the proposed hot knife technique effectively separate the back sheet layers from c-Si PV panels without breaking their integrity and damaging the solar ...

As solar installations grow globally (the market's expected to hit \$370 billion by 2034, per the 2023 Solar Tech Review), professionals can't afford outdated trimming methods. This is where the photovoltaic ...

When you're working with vibration knife cutting technology, you'll achieve exceptional edge refinement that surpasses traditional laser cutting methods. The oscillating blade creates clean, ...
