What is community solar?

The U.S. Department of Energy defines community solar as any solar project or purchasing program, within a geographic area, in which the benefits flow to multiple customers such as individuals, businesses, nonprofits, and other groups. In most cases, customers benefit from energy generated by solar panels at an off-site array.

What is the difference between a community solar system and off-site solar?

Community solar systems, also known as off-site or shared solar, allow residents to purchase or lease a portion of a large solar project that is not located on their property. This is different from on-site solar systems where the solar panels are installed on the property. Community solar systems don't use the local electric grid and therefore, the customers don't pay transmission and distribution fees to a utility company. Off-site community solar projects can serve a larger number of residential customers.

Is community solar a good option?

Community solar can be a great option for people who are unable to install solar panels on their roofs because they are renters, can't afford solar, or because their roofs or electrical systems aren't suited to solar. Community solar is rapidly growing across the country.

Who can participate in community solar?

Customers who do not own their homes, do not have space to install solar, or do not have access to capital can usually still participate in community solar. All community solar programs serve an exclusive set of subscribers within a utility or community choice aggregation service territory. Participation in community solar is always by choice.

Community solar is a term used to describe photovoltaic and renewable energy systems that are shared by many electric customers, including homeowners, renters, businesses, nonprofit ...

Learn what community solar is, how it works, and how you can save 5-20% on electricity bills without installing panels. Complete guide with real examples.

B. Types of Community Solar Models: There are two primary community solar models: subscription-based and ownership-based. Subscription-based models allow participants to rent a ...

What are community photovoltaic panels

Community solar projects are large solar power plants that provide electricity to more than one household. Instead of installing solar panels on your own roof, you can team up with others in ...

Community solar, often shared solar, represents an innovative shift from individual solar panel installations to a model allowing multiple participants to enjoy the benefits of a single solar array.

Community solar projects generate electricity from sunlight and the electricity flows through a meter to the utility grid. Community solar subscribers (i.e., households, businesses, or any other ...

Community solar programs, also known as solar farms, are designed to provide access to solar power to multiple households from a central location. Large plots of land are used to host hundreds (or even ...

Not everyone can put solar panels on their own roof and that doesn't mean you can't benefit from solar power. Community solar (sometimes called "shared solar") offers a way for people ...

Community solar gives customers who cannot install solar on their own property a way to access solar energy. Customers who do not own their homes, do not have space to install solar, or ...

Community solar is when many people or groups benefit from one solar energy system, known as a solar farm. It allows individuals to use solar energy without the need for panel installation.
